ANSYS Workbench Tutorial – Flow Over an Airfoil

Authors: Scott Richards, Keith Martin, and John M. Cimbala, Penn State University Latest revision: 17 January 2011

Introduction

This tutorial provides instructions for creating a fluid volume and mesh around a NACA 4314 airfoil and for analyzing the flow in FLUENT. It also shows how to use multiple fluid bodies and edge sizing to create a "c-mesh". The entire meshed fluid field and a portion of the mesh near the airfoil are shown below.

Generate data points that define the airfoil

- 1. Open an internet browser and go the the NACA 4 Digits Series Profile Generator at <u>http://www.ppart.de/aerodynamics/profiles/NACA4.html</u>.
 - On some computers, Java may be disabled and the website won't display properly. Check your browser's settings if you are having trouble viewing the website.
 - This site enables users to generate any standard NACA 4-digit 2D airfoil.
- 2. Adjust the top three sliders to create a nonsymmetric 4314 airfoil.
- 3. Change *# Points* to "60" and *Point Size* to "4" so that the points are clearly visible.
 - If too many points are used to define the airfoil, DesignModeler won't be able to create the profile of the airfoil because the distance between adjacent points is too small.

- 4. <u>Show Points</u>, then highlight everything that appears in the window to the right of the sliders and copy it to the clipboard.
 - In Windows $\langle Ctrl \rangle + \langle A \rangle$ can be used to highlight the data points, then $\langle Ctrl \rangle + \langle C \rangle$ can be used to copy the selection to the clipboard.
- 5. Open Microsoft Excel.
 - A simple text editing program (such as *vi* in *linux*) can also be used to format the airfoil data. Use the following steps as a guidline to create a compatible file using a text editor:
 - Paste in the data (<Ctrl> + <V> in Windows machines).
 - Create lines of data with five fields separated by spaces or tabs, as described below.
 - Eliminate lines of data that have identical coordinates.
 - Precede comments with "#".
 - Save the data as a simple text file.
- 6. <u>LMB</u> in cell C1 to select it, then paste the data from the clipboard ($\langle Ctrl \rangle + \langle V \rangle$).

- 7. LMB on the "Data" tab. The data should still be highlighted. Text to Columns.
- 8. In Convert Text to Columns, Next. Select "Space" under Delimiters.
- 9. Next, then Finish to separate the data into two columns.
- 10. Insert a blank row between "NACA4314" and the airfoil data.
 - Rows can be inserted by <u>RMB</u> on a row number, then <u>Insert</u>. The new row will be inserted above the row on which you clicked.
- 11. In row 2, type column labels that match the ones shown to the right.
 - + LMB on cell A2 and type "#Group" then

- The "#" is used to denote a comment in DesignModeler coordinate files.
- The first two rows of this excel file help keep the data organized, but they are not required.
- 13. In the first line of data, change the X coordinate to "1" and the Y coordinate to "0".
 - The first data point should be located at the trailing edge of the airfoil, but due to resolution and accuracy limits it is not exactly (1,0).
- 14. Enter "1" in cell A3 and A4, and fill through the rest of column A.
 - \overrightarrow{v} The first column in the spreadsheet denotes the group number for each set of points.
- 15. Starting in cell B3, enter "1" and increase to "2" in cell B4. Fill the rest of the column in numerical order.
- 16. In column B of the last row of data, change the point number to "0".
 - For closed curves, the last point number must be "0" in DesignModeler.
- 17. In cells E3, E4, etc. through the rest of the rows, enter "0" for the Z coordinate of each point.
- 18. <u>Office Button-Save As</u>. After selecting an appropriate folder, name the file "4314_Airfoil_Profile". Change the *Save as type* to "Excel Workbook". <u>Save-OK-Yes</u>.
 - Saving the file as an Excel Workbok isn't necessary, but is done so that the file can be easily modified at a later time in the event that the import into DM is unsuccessful.
- 19. Repeat the procedure from the previous step, but change the *Save as type* to "Text (Tab delimited)". Answer "Yes" (or "OK") to any warnings that may appear; not to worry about these messages.
- 20. Close Excel.

Create a FLUENT template in the Project Schematic window

- 1. This tutorial assumes that ANSYS Workbench is running but no projects are open.
- 2. Under *View* make sure that "Toolbox", "Toolbox Customization" and "Project Schematic" all have check marks next to them.
 - Check marks can be inserted by placing the cursor over the menu item and <u>LMB</u>.
- 3. In *Toolbox Customization* under *Analysis Systems*, verify that "Fluid Flow (FLUENT)" has a check mark next to it.
 - ✤ If column "A" is not shown in *Toolbox Customization*, <u>1</u> located to the left of "Name" in *Toolbox Customization*.
 - To de-clutter your Workbench workspace, close or minimize *Toolbox Customization*; it is not needed after this step.
- 4. In *Toolbox*, not *Toolbox Customization*, <u>Fluid Flow (FLUENT)</u> and hold the LMB to drag it into the box that will appear in *Project Schematic*.
 - If there are no Analysis Systems visible in the *Toolbox*, try ± (clicking "+") next to *Analysis Systems* in *Toolbox*.

Use the data points to create the airfoil in DesignModeler (DM)

- 1. <u>Geometry</u> [bold underline means to double click] in the *Fluid Flow* (*Fluent*) template to open ANSYS *DesignModeler*.
- 2. At startup DM will prompt the user to select the desired length unit. LMB

	А	В	С	D	E
1			#NACA431		
2	#Group	Point	X_cord	Y_cord	Z_cord

<Tab>, type "Point" <Tab>, type "X_cord" <Tab>, type "Y_cord" <Tab> and type "Z_cord".
12. Insert a "#" before "NACA4314" in cell C1.

on the circle next to "Meter", then OK.

✤ If this prompt does not appear, your version of DM was set to always use a certain unit of length. If this is the case, <u>Tools-Options-Units</u>, and set *Display Units Pop-up Window* to "Yes".

- 3. <u>Concept-3D Curve</u>. In *Details View*, <u>Not Selected</u>. Browse to where you saved the airfoil data, select the text file, and <u>Open</u>. Lastly, change *Merge Topology* from "No" to "Yes".
- 4. **<u>Generate</u>** [located in the menu above *Tree Outline*] to create the profile of the airfoil.
 - ➡ If a "!" appeared next to "Curve1" in *Tree Outline*, <u>R-Curve1-Show Errors or Warnings</u> to display the reason why the 3D curve was not successful.
- 5. In the *Display Toolbar*, Look at Face/Plane/Sketch
 - V If you want to find out the name of any toolbar button, hover over the button with the cursor to display its name.
- <u>Concept-Surfaces from Edges</u>. <u>LMB</u> on the curve that was created in the previous step to select it. When it turns green to signify that it has been selected, <u>Apply</u> and <u>*i*</u><u>Generate</u>. The inside of the airfoil should now be shaded it is a surface.
- 7. <u>Create-Thin/Surface</u>. Select the surface created in the previous step by <u>LMB</u> on it, then <u>Apply</u> in *Details View*.
- 8. Change Direction from "Inward" to "Outward".
- 9. <u>LMB</u> on the box to the left of *FD1*, *Thickness*. For *Parameter Name*, type "ExtrusionLength". <u>OK</u>.
- 10. In *Tree Outline*, <u>R-"Thin1"</u>-<u>Rename</u>. Name this body "Airfoil" and <Enter>. <u>≇Generate</u>.
- 11. In *Tree Outline*, <u>LMB</u> on "+" that is to the left of "2 Parts, 2 Bodies". <u>R-"Solid"-Rename</u>. Type "Airfoil" as the name for the solid and <Enter>.

Create the fluid volume

- 1. <u>Create-Primitives-Box</u>.
- 2. In *Details View*, **From One Point and Diagonal** to change *Box Type* to "From Two Points".
- 3. Enter the coordinates for Point 1: X = "1" m, Y = "-10" m, and Z = "0" m.
- 4. Enter the coordinates for Point 2: X = "20" m, Y = "10" m.
- 5. To set the value for *Point 2 Z Coordiante*, <u>LMB</u> in the box to the left of the label. For *Parameter Name*, type "ExtrusionLength", then OK. [€]Generate.
 - Vising defined parameters to set dimensions makes changing dimensions easier later on.
- 6. <u>Create-Primitives-Cylinder</u>.
- 7. In *Details View*, set *Origin X Coordinate* = "1" m. *Set FD10*, *Radius* = "10" m.
- 8. <u>LMB</u> in the box to the left of *FD8*, *Axis Z Coordinate*. For *Parameter Name*, type "ExtrusionLength", then <u>OK</u>. [€]Generate.
- 9. Look at Face/Plane/Sketch

Remove airfoil from fluid volume

- 1. Create-Boolean.
- 2. Change Operation from "Unite" to "Subtract".
- 3. In *Tree Outline*, <u>LMB</u> on "+" that is to the left of "3 Parts, 3 Bodies" to display available bodies if necessary (this may already be selected).
- 4. For *Target Bodies*, <u>Not Selected</u>, choose "<u>Solid</u>" in *Tree Outline*, and <u>Apply.</u>

Details View

	FD10, Radius (>0)	10 m			
	As Thin/Surface?	No			

- 5. For *Tool Bodies*, <u>Not Selected</u>, choose "<u>Airfoil</u>" in *Tree Outline*, and <u>Apply.</u> ³Generate.
- 6. Tools-Freeze.
 - Freezing prevents the geometry from combining with geometry that is created after the freeze.
 - **v** Rotate slightly by dragging the MMB; you should see a small thickness of the airfoil body.
- 7. In *Tree Outline*, <u>LMB</u> on "Solid" under "2 Parts, 2 Bodies". In *Details View*, change *Body* to "Fluid" and *Fluid/Solid* to Fluid.

Slice the fluid volume and exit DM

<u>Create-Slice</u>. Select "ZXPlane" from *Tree Outline*. <u>Apply</u> to assign the selected plane as the Base Plane. <u>[≸]Generate</u>.

Slicing the fluid volume into smaller volumes allows for greater control over mesh sizing.

- 2. <u>New Plane</u> [★]. In *Details View*, set *Base Plane* as "YZPlane" (Select it in *Tree Outline* and <u>Apply</u>). Change *Transform 1 (RMB)* to "Offset Z". Set *FD1*, *Value 1* = "1"m. [₹]Generate.
- <u>Create-Slice</u>. Select "Plane4" from *Tree Outline*. <u>Apply</u> to assign the selected plane as the Base Plane. <u>³/₂ Generate</u>.
- 4. Simultaneously select the four volumes ("Fluid") under "5 Parts, 5 Bodies" in the *Tree Outline*. RMB-
- 5. <u>File-Save Project</u>. After selecting an appropriate folder in which to save the project, enter "4314Airfoil" for the *File Name*, and <u>Save</u>.
- 6. Close DM.
 - **W** In Workbench, "Geometry" should now have a check mark.

Set the meshing method

- 7. <u>Mesh</u> in the *Fluid Flow (Fluent)* template to open *ANSYS Meshing*.
- From the *Meshing Options* window that opens, select "Tetrahedrons (Patch Independent)" to set the *Mesh Method*. <u>OK</u>.
 - The *Physics Preference* was automatically set to *CFD* when
 "Fluid Flow (<u>FLUENT</u>)" was chosen for the *Analysis*

System. Thus, it is not necessary to specify a preference in Meshing Options.

- 9. <u>Units-Metric (m, kg, N, s, V, A)</u>.
- 10. In Outline, LMB on "Patch Independent".
- 11. Use the drop down menu to change *Method* from "Tetrahedrons" to "Automatic".

Label faces

- 1. In an empty area of Graphics, <u>RMB-View-Front</u>.
- 2. Group-select the four exposed faces. <u>RMB-Create</u> <u>Named Selection</u>. Enter "Front Symmetry" as the name for the group of faces. <Enter>.
 - Hold <Ctrl> while <u>LMB</u> to make multiple selections.
- 3. <u>RMB-View-Back</u>.
- 4. Group-select the four exposed faces. <u>RMB-Create</u> <u>(CFX-Mesh</u> <u>Named Selection</u>. Enter "Back Symmetry" as the name for the group of faces. <Enter>.
- 5. <u>RMB-View-Right</u>.
- 6. Scroll the MMB to zoom in until two faces are visible.
- 7. Group-select the two exposed faces. <u>RMB-Create Named Selection</u>. Enter "Outlet" as the name for the group of faces. <Enter>.
- 8. <u>RMB-View-Top</u>.

🗸 🕎 5 Parts, 5 Bodies					
Line	Body

💮 🖓 Fluid	💡 Hide Body				
🗊 Fluid	💡 Hide All Other Bodies				
🚽 🖓 🖓 Fluid	🔞 Suppress Body				
	⊕ [⊕] Form New Part				

Mesh Method

- Automatic (Patch Conforming/Sweeping)
- Tetrahedrons (Patch Independent)
- Tetrahedrons (Patch Conforming)
- O CFX-Mesh

- 9. Zoom in until surfaces are visible. LMB on one of the exposed faces. LMB ² from the toolbar. Extend to Limits.
- 10. RMB-Create Named Selection. Enter "Inlet" as the name for the group of faces. < Enter>.
- 11. RMB-View-Front.
- 12. LMB Named Selections in the Outline. The labeled selections should look similar to the ones to the right.

Insert edge sizing control

- 1. LMB "Mesh" in Outline.
- 2. LMB the rectangular face located in the top right. RMB-

Insert-Mapped Face Meshing.

- 3. Repeat the previous step for the rectangular face located in the bottom-right.
- 4. In Outline, LMB on the "+" next to "Geometry". LMB on the "+" next to "Part". RMB on the first "Fluid" and Suppress All Other Bodies.
 - Edge sizing helps smooth the transition between the 8 four separate fluid volumes and creates a refined mesh around the airfoil.
- 5. LMB "Mesh" from Outline.
- 6. Edge from the *Display Toolbar*.
- 7. LMB the left edge of the rectangle, then <u>RMB-Insert-Sizing</u>. Enter ".2"m for *Element Size*.
- 8. LMB the right edge of the rectangle, then RMB-Insert-Sizing. Enter ".2"m for Element Size. Choose the second *Bias Type* from the drop down menu. Enter "10" for Bias Factor.
- 9. LMB the top edge of the rectangle, then RMB-Insert-Sizing. Enter ".2" m for Element Size. Choose the first Bias Type from the drop down menu. Enter "50" for Bias Factor.
- 10. LMB the bottom edge of the rectangle, then RMB-Insert-Sizing. Enter ".2" m for Element Size. Choose the first Bias Type from the drop down menu. Enter "50" for Bias Factor.
- 11. In Outline, RMB on the third "Fluid" under Part and Unsuppress All Bodies. RMB on the third "Fluid" and Suppress All Other Bodies.
- 12. LMB "Mesh" from *Outline*. Make sure Edge is the current selection filter.
- 13. LMB the left edge of the rectangle, then RMB-Insert-Sizing. Enter ".2"m for *Element Size*.
- 14. LMB the right edge of the rectangle, then RMB-Insert-Sizing. Enter ".2"m for Element Size. Choose the first Bias Type from the drop down menu. Enter "10" for Bias Factor.
- 15. LMB the top edge of the rectangle, then RMB-Insert-Sizing. Enter ".2"m for Element Size. Choose the second Bias Type from the drop down menu. Enter "50" for Bias Factor.
- 16. In *Outline*, RMB on the fourth "Fluid" under *Part* and Unsuppress All Bodies.
- 17. LMB "Mesh" from *Outline*. Make sure Edge is the current selection filter.
- 18. LMB the horizontal edge between the two pie-shaped faces. RMB-Insert-Sizing. Enter ".2"m for *Element Size.* Choose the second *Bias Type* from the drop down menu. Enter "50" for *Bias Factor*. - Sizing
- 19. LMB "Mesh" from Outline. In Details of "Mesh". LMB on the "+" next to "Sizing". Change Min Size to ".00001"m.

Sizing	
Use Advanced Si	On: Curvature
Relevance Center	Coarse
Initial Size Seed	Active Assembly
Smoothing	Medium
Transition	Slow
Span Angle Center	Fine
Curvature Norma	Default (18.0 °)
Min Size	.00001

Create mesh

- 1. <u>R-Mesh- $\frac{3}{6}$ Generate Mesh</u>.
- 2. When completed, the mesh should look like the one to the right.
- 3. Zoom in and pan to view the mesh around the airfoil.
- 4. <u>File-Save Project</u>. Close *ANSYS Meshing* and return to ANSYS Workbench.

Update mesh and launch FLUENT

- In the *Project Schematic* of ANSYS Workbench, <u>R-Mesh</u> from the analysis template, then ³<u>Update</u>. A check mark should now appear to the right of both *Geometry* and *Mesh*.
- 6. <u>Setup</u> from the *Project Schematic* to open *FLUENT Launcher*. In *FLUENT Launcher*, verify that the box next to "Double Precision" is selected, then <u>OK.</u>
 - If the box next to "Double Precision" is not checked, <u>LMB</u> in the box to select it before clicking <u>OK</u>.
 - Some older software versions may give an error. If you get an error, close ANSYS Workbench, reopen it, and repeat Step 2.
- 7. The next screen will be the main *FLUENT Window* with your mesh in the *Graphics Window*.

Set solver model

1. In the main *FLUENT* menu, <u>Define-Models-Viscous - Laminar-Edit</u>. Laminar flow is the default, so we really don't need to do anything here. Later on, however, you may need to specify turbulent flow calculations; this is where the turbulence models are specified in FLUENT, options of which are shown to the right. <u>OK</u>.

Define the fluid as liquid water

1. The default fluid is air, but we want to define the fluid as water. In the main *FLUENT* menu, <u>Define-Materials-Create/Edit-FLUENT</u>

Database. Select water-liquid from the list of *FLUENT Database Materials*. Copy.

- 2. Write down the density and viscosity of liquid water. These properties are needed later to calculate Reynolds numbers, etc. <u>Close</u>.
- 3. <u>Close</u> the *Create/Edit Materials* window. *Caution*: This has added liquid water into the list of available fluids, but has not actually changed the fluid from air to water. This will be done next.

Define the cell zones and boundary conditions

- In the main *FLUENT* menu, <u>Define-Cell Zone Conditions</u>. There should be only one zone, "part-fluid". Make sure *Type* is set as <u>fluid</u>. <u>Edit</u>. Select "<u>water-liquid</u>" instead of "air" as the material. <u>OK</u>.
- 2. Now the boundary conditions need to be specified. Previously, the boundary conditions were named, e.g., inlet, symmetry, etc., but actual values for inlet velocity, etc. were never defined. This must be done in FLUENT. In the main *FLUENT* menu, <u>Define-Boundary Conditions</u>.
- 3. The default boundary condition for the wall (airfoil surface) is okay, so nothing needs to be done to it.
- 4. Likewise, the default boundary conditions for the symmetry planes and the outlet are okay, so nothing needs to be done to them.
- 5. Select <u>inlet</u>. <u>Edit</u>. Select "Magnitude and Direction" from

Velocity Specification Method	Magnitude and Direction 👻
Reference Frame	Absolute 👻
Velocity Magnitude (m/s)	10 constant 🗸

💶 Viscous Model 🛛 🛛 🔀
Model
 Inviscid Laminar Spalart-Allmaras (1 eqn) k-epsilon (2 eqn) k-omega (2 eqn) Transition k-kl-omega (3 eqn) Transition SST (4 eqn) Reynolds Stress (5 eqn)
OK Cancel Help

the drop down menu for *Velocity Specification Method*. Change *Velocity Magnitude* to "10" m/s, and <u>OK</u>.

Set convergence criteria

- 1. In the main FLUENT menu, Solve-Monitors-Residuals.... Edit.
- 2. In the *Residual Monitors* window that opens, make sure both <u>Plot</u> and <u>Print to Console</u> options are specified in the *Options* portion of the window.
 - Figure 4.2. Here, "Print" refers to text printed in the main *FLUENT* window, and "Plot" graphs the residuals on the screen while the code is iterating.
 - As the code iterates, residuals are calculated for each flow equation. Residuals represent a kind of average error in the solution the smaller the residual, the more converged the solution.
- 3. Since there are four differential equations to be solved in a three-D incompressible laminar flow problem, there are four residuals to be monitored for convergence: continuity, *x*-velocity, *y*-velocity, and *z*-velocity. The default convergence criteria are 0.001 for all four of these. Experience has shown that this value is generally not low enough for proper convergence. Change the *Convergence Criterion* for all three residuals from 0.001 to 0.000001 (enter three additional zeroes).
- 4. To apply the changes, <u>OK</u>.
- 5. In the main *FLUENT* menu, <u>Solve-Initialization</u>. The default initial values of velocity and gage pressure are all zero. These are good enough for this problem. <u>Initialize</u>.
- 6. <u>File-Save Project</u>.
 - Fluent writes two files in addition to the Workbench file: the *case* file (the grid plus all boundary conditions and other specified parameters) and the *data* file (the velocity and pressure fields calculated by the code).

Iterate towards a solution

- 1. In the main *FLUENT* menu, <u>Solve-Run Calculation</u> to open up the *Run Calculation* sub-window. Change *Number of Iterations* to 200, and <u>Calculate</u>. The main screen will list the residuals after every iteration, while the graphical display window will plot the residuals as a function of iteration number.
 - The residuals may rise at first, but should slowly start to fall. It is normal for the residuals to fluctuate up and down. Do not be concerned if there are reverse flow warnings; these will disappear in time.
- 2. When the solution is done or converged, <u>OK</u>.
- 3. Check to see how the solution is progressing. In the main *FLUENT* menu, <u>Display-Graphics and</u> <u>Animations-Vectors-Set Up</u> [the upper <u>Set Up</u>, not the lower one].
- 4. In the *Vectors* window that opens, select "interior-part-fluid" under *Surfaces*. <u>Display</u>. Velocity vectors will be displayed.
- 5. Go get a better view of the vector field, rotate the vector field by <u>LMB</u> while dragging the cursor.
- 6. Zoom in on the airfoil to view the velocity field in more detail. It should look similar to the velocity field to the right. <u>Close</u> the *Vectors* window.

- + To zoom in, drag a box with the MMB from the lower left to upper right.
- + To zoom out, drag a box with the MMB from the upper right to the lower left.
- 7. The current mesh is sufficient for 200 iterations and initial calculations, but the mesh must be refined before iterating further.

Refine the mesh and iterate some more

1. Our mesh is not tight enough near the airfoil surface to properly resolve the boundary layer. Fortunately, FLUENT has a feature that automatically adds grid points where needed for better

resolution. There are several options for grid adaptation – we will adapt by velocity gradient.

- In the main *FLUENT* menu, <u>Adapt-Gradient</u>. In the new *Gradient Adaption* window, select Gradients of <u>Velocity</u>.
- 3. <u>Compute</u>. Minimum and maximum velocity gradients will appear in the window.
- 4. As a good rule of thumb, set the *Refine Threshold* to about 1/10 of the maximum gradient. Enter this value in the appropriate text box.

Options	Method	Gradients of	
Coarsen	Gradient	Velocity Magnitude	
		Min	Max
Contours	Normalization	1.147025e-09	0.02824493
Manage	 Standard Scale Normalize 	Coarsen Threshold	Refine Threshold
	Dynamic		

- 5. <u>Mark</u>. The main *FLUENT* window will display how many cells have been selected for refining and coarsening.
 - The coarsening cells can be ignored since FLUENT is unable to coarsen the original grid it can only refine the original grid.
- 6. *Optional*: If you want to see where the grid will be adapted, click <u>Manage-Display</u>. Areas destined for grid refinement will be highlighted.
- 7. Back in the *Gradient Adaption* window, <u>Adapt-Yes</u>. The main *FLUENT* window will display some information about the grid adaptation.
- 8. The *Gradient Adaption* window can be closed at this point.
- 9. <u>Solve-Run Calculation</u> from the main *FLUENT* menu to re-open the *Run Calculation* sub-window. Change <u>Number of Iterations</u> to 500, and <u>Calculate-OK</u>.
- 10. When the solution is done or converged, <u>OK</u>.
- 11. Check to see how the solution is progressing. In the main *FLUENT* menu, <u>Display-Graphics and</u> <u>Animations-Vectors-Set Up-Display</u>. The graphical display window will show velocity vectors. The vectors should be closer together in regions where the mesh was refined.
- 12. <u>Close</u> the *Vectors* window.
- 13. Zoom **in** (MMB lower left to upper right) or **out** (MMB upper right to lower left) and move (<u>MMB</u> where you want to center the view) as necessary to see the velocity field.

Iterate towards a final solution

- 1. Following the procedure outlined previously in the section called "**Refine the mesh and iterate some more**", refine the grid and re-iterate as necessary (three times) to obtain a final solution. Each time you adapt the grid, you must re-calculate the gradients (<u>Compute</u>), re-adjust the refine threshold (set to about 1/10 of the maximum gradient), <u>Mark</u>, <u>Adapt-Yes</u>.
- 2. Calculate at least 400 iterations after each grid adaption. The residuals will rise dramatically after an adaption, but will decay as the solution adjusts itself to the newly refined grid.
 - *Caution*: Don't adapt too much, or the computations will take too much CPU time. Note that every time you refine the grid, the computer must calculate the flow field at more grid points, requiring longer for successive iterations.
- 3. When finished adapting, run several hundred iterations until the residuals level off, or until the convergence criteria are reached.

Examine the velocity profiles in detail

- 1. The velocity profile at three locations (x = 0.00, 0.05, and 0.20 m) will be plotted and examined in detail.
- 2. In the main *FLUENT* window, on the left side under *Results*, Plots-XY Plot-Set Up.
- 3. A window called *Solution XY Plot* will open. <u>LMB</u> the drop down menu beside New Surface and select Line/Rake...
- 4. To create the first profile, set $x_0 = 0$, $y_0 = 0$, $z_0 = 0$ and $x_1 = 0$, y_1 = 0.5, z_1 = 0. Rename the surface "profile0.0" in the New Surface Name text box. Create.
- 5. To create the second profile, set $x_0 = 0.05$, $y_0 = 0$, $z_0 = 0$ and x_1 = 0.05, $y_1 = 0.5$, $z_1 = 0$. Rename the surface "profile0.05" in the New Surface Name text box. Create.
- 6. To create the third profile, set $x_0 = 0.2$, $y_0 = 0$, $z_0 = 0$ and $x_1 = 0$ 0.2, $y_1 = 0.5$, $z_1 = 0$. Rename the surface "profile0.2" in the New Surface Name text box. Create.
- 7. Close the *Line/Rake Surface* window.
- 8. Back in the Solution XY Plot window, select (highlight) profile0.00, profile0.05, and profile0.20.
- 9. In the upper left corner of the window, turn off (uncheck) Position on X Axis, and turn on (check) Position on Y Axis. This will make the vertical axis the y position on the plot.
- 10. Set Plot Direction to X = 0 and Y = 1. This will make the *y*-coordinate position appear on the vertical axis, as desired for a standard velocity profile plot.
- 11. The upper right part of the window selects the variable to be plotted. The YAxis Function will be set automatically to Direction Vector, and should be left alone. For the X Axis Function, select Velocity and (just below that) X-Velocity. Plot.

12. If done correctly, all three profiles should be visible on the plot and should look like the profile to the right. The initial increase in x-velocity with downstream position on the airfoil should be apparent. Notice how as the position above the horizontal axis increases (vertical axis), the velocity approaches the free stream velocity of 10

m/s regardless of the position along the airfoil.

13. Close the Solution XY Plot window.

Save your velocity profiles and your calculations

- 1. In the main *FLUENT* menu, <u>File-Export-Case & Data</u>. In the *Select File* window that opens, name the file with an extension ".cas.gz". Make sure the *Write Binary Files* option is checked. <u>OK</u> to write the file. You might have to <u>OK</u> again to overwrite these files if they already exist.
 - The ".gz" at the end of the file name causes FLUENT to save the file in a condensed or "zipped" format, which saves disk space.
- 2. Before saving the plot, your name and a short description should be added to the title. On the graphics window where the plot is visible, <u>LMB</u> just below the existing plot title ("X Velocity") in the bottom left of the plot. A cursor should appear. Type your name(s) on the plot title.
 To some operating systems, you may have to RMB instead of LMB to get the text cursor.
- 3. In the main *FLUENT* menu, <u>File-Save Picture</u>. Select <u>TIFF</u>. Select <u>Color</u> if desired, and <u>Save</u>. Give a unique, descriptive name to the file (something with your name in it, like "laminar_airfoil_profiles_*Lastname_Firstname*.tif" is appropriate). <u>OK</u>, and <u>Close</u>. The .tif file just generated can be inserted into a Microsoft Word document later.

Exit FLUENT

1. In the main FLUENT menu, File-Save Project.

3. In Workbench, ^{*i*}<u>Update Project</u>. After some calculations, check marks should appear on all components of the *Fluid Flow (FLUENT)* template in *Project Schematic*.

•		A		
1		Fluid Flow (FLUENT)		
2	M	Geometry	~	4
3		Mesh	\checkmark	
4		Setup	\checkmark	4
5	1	Solution	\checkmark	4
6	@	Results	~	4
		Fluid Flow (FLUENT)		

ANSYS

4. You are now finished with this tutorial. <u>File-Exit-Yes</u> (save the file).
