## Measuring Mass Moment of Inertia as a Simple Pendulum

$\mathrm{m}=$ mass
$\mathrm{J}_{\mathrm{G}}=$ mass moment about centroid
a $=$ distance from pivot to centroid
$g=$ acceleration of gravity
$\tau=$ time period for one oscillation
$\sum \mathrm{M}$ about P CCW +
$-(m g \sin \phi) a=\left(J_{G}+m a^{2}\right) \ddot{\phi}$
$\left(J_{G}+\mathrm{ma}^{2}\right) \ddot{\phi}+\mathrm{mga} \sin \phi=0$

for small angles $\phi<15^{\circ}, \quad \sin \phi \approx \phi$
$\left(\mathrm{J}_{\mathrm{G}}+\mathrm{ma}^{2}\right) \ddot{\phi}+\mathrm{mga} \phi=0$
assume $\phi=\phi_{\text {MAX }} \cos (2 \pi f t) \quad \dot{\phi}=-\phi_{\text {MAX }} 2 \pi f \sin (2 \pi f t) \quad \ddot{\phi}=-\phi_{\text {MAX }} 4 \pi^{2} f^{2} \cos (2 \pi f t)$
$-\left(\mathrm{J}_{\mathrm{G}}+\mathrm{ma}^{2}\right) \phi_{\mathrm{MAX}} \cos (2 \pi \mathrm{ft})+\mathrm{mg}$ a $\phi_{\mathrm{MAX}} \cos (2 \pi \mathrm{ft})=0$
$4 \pi^{2} f^{2}\left(J_{G}+\mathrm{ma}^{2}\right)=\mathrm{mga}$
using $\tau=1 / \mathrm{f}$
$J_{G}+\mathrm{ma}^{2}=\frac{\mathrm{mga} \tau^{2}}{4 \pi^{2}}$
$2 \times 4 \times 24$ from Notes_07_01 $J_{G}=111.9 \mathrm{lbm} . \mathrm{in}^{2}$
$\mathrm{m}=2.286 \mathrm{lbm} \quad \mathrm{a}=12.25 \mathrm{in} \quad 20 \tau=25.74 \mathrm{sec} \quad \tau=1.2870 \mathrm{sec}$
$\frac{\mathrm{mga} \tau^{2}}{4 \pi^{2}}=\left(\frac{2.286 \mathrm{lbm}}{4 \pi^{2}}\right)\left(\frac{386 \mathrm{in}}{\mathrm{sec}^{2}}\right)(12.25 \mathrm{in})(1.2870 \mathrm{sec})^{2}=453.52 \mathrm{lbm} . \mathrm{in}^{2}$
$\mathrm{ma}^{2}=(2.286 \mathrm{lbm})(12.25 \mathrm{in})^{2}=343.04 \mathrm{lbm} . \mathrm{in}^{2}$
$\mathrm{J}_{\mathrm{G}}=110.48 \mathrm{lbm} . \mathrm{in}^{2}(-1.2 \%$ difference $)$

## Measuring Mass Moment of Inertia with Torsional Pendulum

Torsional pendulums use a lightweight circular or triangular platform suspended from three light cables as shown below. The platform must be horizontal and the cables must be of equal length. The cables should be attached to the platform equidistant from the center of the platform in an equilateral triangular pattern. Cable attachments need not be at the edge of the platform.

The object should be placed with its center of mass directly over the center of the platform. The centroidal axis of the object must be vertical. The platform must oscillate in pure rotation with small angular displacement about the central vertical axis and must not swing laterally.

This procedure should be used first with an empty platform to determine the mass moment of the platform alone and then repeated with the object centered on the platform to measure the mass moment of the object plus the platform.

Reference: Shigley, J.E. and J.J. Uicker, Theory of Machines and Mechanisms
McGraw-Hill, 1995, second edition
$J_{G O}+J_{G P}=\frac{g\left(m_{O}+m_{P}\right) r^{2} \tau^{2}}{4 s \pi^{2}}$
$\mathrm{J}_{\mathrm{GO}}=$ centroidal polar mass moment of inertia of object
$\mathrm{J}_{\mathrm{GP}}=$ centroidal polar mass moment of inertia of platform
$\mathrm{g}=$ acceleration of gravity
$\mathrm{m}_{\mathrm{O}}=$ mass of object
$\mathrm{m}_{\mathrm{P}}=$ mass of platform
$r=$ radius of cable attachments from center of platform (not platform radius)
$\tau=$ time period for one torsional oscillation
$\mathrm{s}=$ length of cables

## Measuring Mass Moment of Inertia with Platform Pendulum

Platform pendulums use a lightweight rectangular platform suspended from four light cables as shown below. The platform must be horizontal and the cables must be of equal length. Cable attachments need not be at the edge of the platform. Pendulum design should minimize ao to maximize accuracy.

The object should be placed with its center of mass directly over the center of the platform. The centroidal axis of the object must be horizontal. The platform must swing laterally with small displacement about the centerline of the cable pivots and must not twist or swing axially.

This procedure should be used first with an empty platform to determine the mass moment of the platform itself and then repeated with the object centered on the platform to measure the mass moment of the object plus the platform.

Reference: Mabie, H.H. and C.F. Reinholtz, Mechanisms and Dynamics of Machinery, Wiley, 1987, fourth edition
$J_{G O}+m_{o} a_{O}^{2}+J_{P}=\frac{g\left(m_{O} a_{O}+m_{P} a_{P}\right) \tau^{2}}{4 \pi^{2}}$
$\mathrm{J}_{\mathrm{GO}}=$ centroidal polar mass moment of inertia of object
$\mathrm{J}_{\mathrm{P}}=$ polar mass moment of inertia of platform
$\mathrm{g}=$ acceleration of gravity
$\mathrm{m}_{\mathrm{O}}=$ mass of object
$\mathrm{m}_{\mathrm{P}}=$ mass of platform
$a_{0}=$ distance from pivot to centroid of object
$\mathrm{a}_{\mathrm{p}}=$ distance from pivot to centroid of platform
$\tau=$ time period for one oscillation

## Measuring Mass Moment of Inertia and Centroid Location Simultaneously

## Small objects

1) Suspend object by point $P_{1}$ and measure $\tau_{1}$
2) Suspend object by point $\mathrm{P}_{2}$ and measure $\tau_{2}$
3) Measure $m$
4) Measure distances $e, \mathrm{ID}_{\mathrm{B}}, \mathrm{ID}_{\mathrm{C}}$
$\mathrm{J}_{\mathrm{G}}+\mathrm{ma}_{1}{ }^{2}=\frac{\mathrm{mga}_{1} \tau_{1}{ }^{2}}{4 \pi^{2}}$
$\mathrm{J}_{\mathrm{G}}+\mathrm{ma}_{2}{ }^{2}=\frac{\mathrm{mga}_{2} \tau_{2}{ }^{2}}{4 \pi^{2}}$
$4 \pi^{2}\left(\mathrm{a}_{1}{ }^{2}-\mathrm{a}_{2}{ }^{2}\right)=\mathrm{ga}_{1} \tau_{1}{ }^{2}-\mathrm{ga}_{2} \tau_{2}{ }^{2}$
$\mathrm{a}_{2}=\mathrm{e}-\mathrm{a}_{1} \quad \mathrm{a}_{2}{ }^{2}=\mathrm{e}^{2}-2 \mathrm{a}_{1}+\mathrm{a}_{1}{ }^{2}$
$\mathrm{a}_{1}=\frac{\mathrm{e}\left(\mathrm{g} \tau_{2}{ }^{2}-4 \pi^{2} \mathrm{e}\right)}{\mathrm{g}\left(\tau_{1}{ }^{2}+\tau_{2}{ }^{2}\right)-8 \pi^{2} \mathrm{e}}$
$\mathrm{BG}=\mathrm{a}_{2}-\mathrm{ID}_{\mathrm{B}} / 2 \quad \mathrm{CG}=\mathrm{a}_{1}-\mathrm{ID}_{\mathrm{C}} / 2$

## Suspended objects

1) Suspend object by point $P_{1}$ and measure $\tau_{1}$
2) Suspend object by point $P_{2}$ and measure $\tau_{2}$
3) Measure $m$
4) Measure distance $f$

$$
\begin{aligned}
& \mathrm{a}_{2}=\mathrm{f}+\mathrm{a}_{1} \quad \mathrm{a}_{2}{ }^{2}=\mathrm{f}^{2}+2 \mathrm{f} \mathrm{a}_{1}+\mathrm{a}_{1}{ }^{2} \\
& \mathrm{a}_{1}=\frac{\mathrm{f}\left(\mathrm{~g} \tau_{2}{ }^{2}-4 \pi^{2} \mathrm{f}\right)}{\mathrm{g}\left(\tau_{1}{ }^{2}-\tau_{2}{ }^{2}\right)+8 \pi^{2} \mathrm{f}}
\end{aligned}
$$

## Measuring Mass Moment of Inertia and Centroid using Multiple Pivots

1) Suspend object by points $P_{1}, P_{2}, \cdots, P_{n}$ and measure $\tau_{1}, \tau_{2}, \cdots, \tau_{n}$. All points on same body.
2) Measure local coordinates $\left\{\begin{array}{l}x \\ y\end{array}\right\}^{\prime P 1},\left\{\begin{array}{l}x \\ y\end{array}\right\}^{\prime P 2}, \cdots,\left\{\begin{array}{l}x \\ y\end{array}\right\}^{\prime P n}$
3) Weigh the object to measure $m$

$$
\mathrm{J}_{\mathrm{G}}+\mathrm{ma}_{\mathrm{i}}{ }^{2}=\frac{\mathrm{mga}_{\mathrm{i}} \tau_{\mathrm{i}}{ }^{2}}{4 \pi^{2}} \quad \mathrm{a}_{\mathrm{i}}{ }^{2}=\left(\mathrm{x}^{\prime P \mathrm{Pi}}-\mathrm{x}^{\prime \mathrm{G}}\right)^{2}+\left(\mathrm{y}^{\prime \mathrm{Pi}}-\mathrm{y}^{\prime \mathrm{G}}\right)^{2}
$$

iteratively solve for $\{q\}=\left\{\begin{array}{l}\mathrm{x}^{\prime \mathrm{G}} \\ \mathrm{y}^{\prime \mathrm{G}} \\ \mathrm{J}_{\mathrm{G}}\end{array}\right\} \quad$ using $\quad\{\Phi\}=\left\{\begin{array}{c}\mathrm{J}_{\mathrm{G}}+\mathrm{ma}_{1}{ }^{2}-\mathrm{mg} \mathrm{a}_{1} \tau_{1}{ }^{2} / 4 \pi^{2} \\ \mathrm{~J}_{\mathrm{G}}+\mathrm{ma}_{2}{ }^{2}-\mathrm{mg} \mathrm{a}_{2} \tau_{2}{ }^{2} / 4 \pi^{2} \\ \vdots \\ \mathrm{~J}_{\mathrm{G}}+\mathrm{ma}_{\mathrm{n}}{ }^{2}-\mathrm{mg} \mathrm{a}_{\mathrm{n}} \tau_{\mathrm{n}}{ }^{2} / 4 \pi^{2}{ }^{2}\end{array}\right\}$
$\{\mathrm{q}\}_{\mathrm{k}+1}=\{\mathrm{q}\}_{\mathrm{k}}-\left(\left[\Phi_{\mathrm{q}}\right]^{\mathrm{T}}\left[\Phi_{\mathrm{q}}\right]\right)^{-1}\left[\Phi_{\mathrm{q}}\right]^{\mathrm{T}}\{\Phi\}$
$\frac{\partial \Phi_{i}}{\partial x^{\prime G}}=-m\left(2 a_{i}-g \tau_{1}{ }^{2} / 4 \pi^{2}\right) \frac{\left(x^{\prime P i}-x^{\prime G}\right)}{a_{i}} \quad \frac{\partial \Phi_{i}}{\partial y^{G}}=-m\left(2 a_{i}-g \tau_{1}{ }^{\prime} / 4 \pi^{2}\right) \frac{\left(y^{\prime P i}-y^{\prime G}\right)}{a_{i}}$

$$
\left[\Phi_{\mathrm{q}}\right]=\left[\begin{array}{ccc}
\partial \Phi_{1} / \partial \mathrm{x}^{\prime \mathrm{G}} & \partial \Phi_{1} / \partial \mathrm{y}^{\mathrm{G}} & 1 \\
\partial \Phi_{2} / \partial \mathrm{x}^{\prime \mathrm{G}} & \partial \Phi_{2} / \partial \mathrm{y}^{\mathrm{G}} & 1 \\
\vdots & \vdots & \vdots \\
\partial \Phi_{\mathrm{n}} / \partial \mathbf{x}^{\prime \mathrm{G}} & \partial \Phi_{\mathrm{n}} / \partial \mathbf{y}^{\prime \mathrm{G}} & 1
\end{array}\right]

Mass Properties Instruments Know-How

Mass Properties
Analyals

We design and manufacture a complete range of mass properties measurement instruments and accessories. By employing both strain gauge and magnetic force restoration technology, we have ensured that you will find a solution that's sure to meet your measurement accuracy requirements.
